AI RELATED EMPLOYMENT UNDER DIFFERENT SCENARIOS

All four scenarios show a steady increase in AI-related employment from 2024 to 2035, with TS and HS projecting the highest employment levels by 2035.

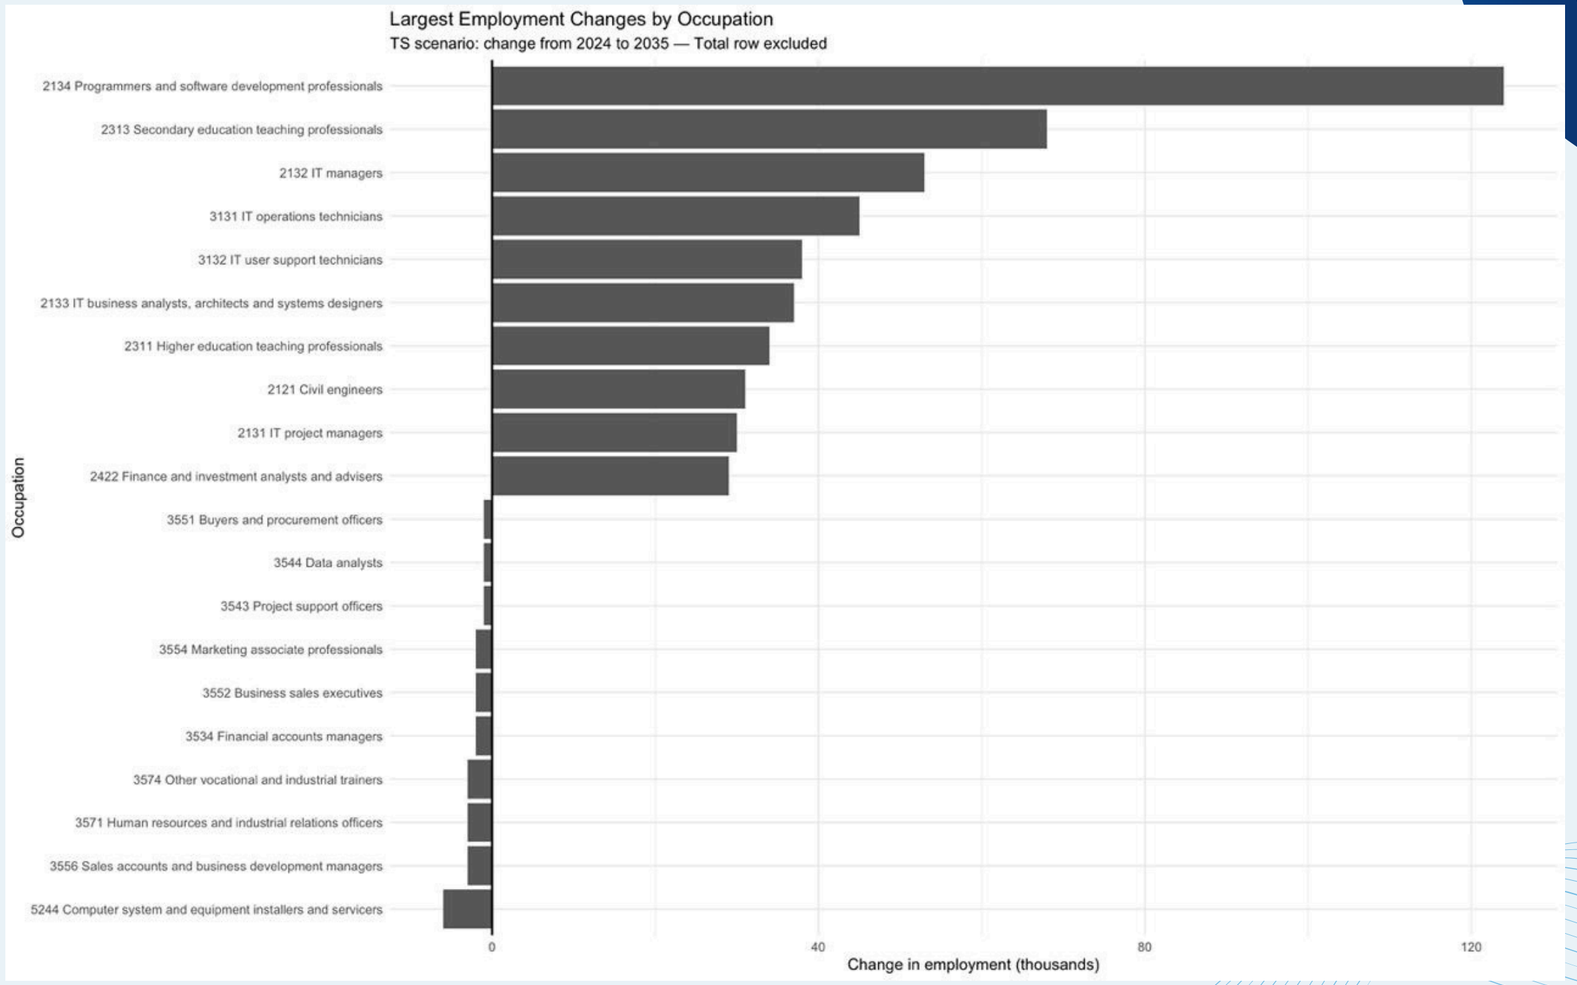

TOP 10 AI-RELATED OCCUPATIONS BY 2035

Programmers and software development professionals have the highest projected employment, followed by secondary education teachers, showing that AI-related employment extends beyond purely technical occupations.

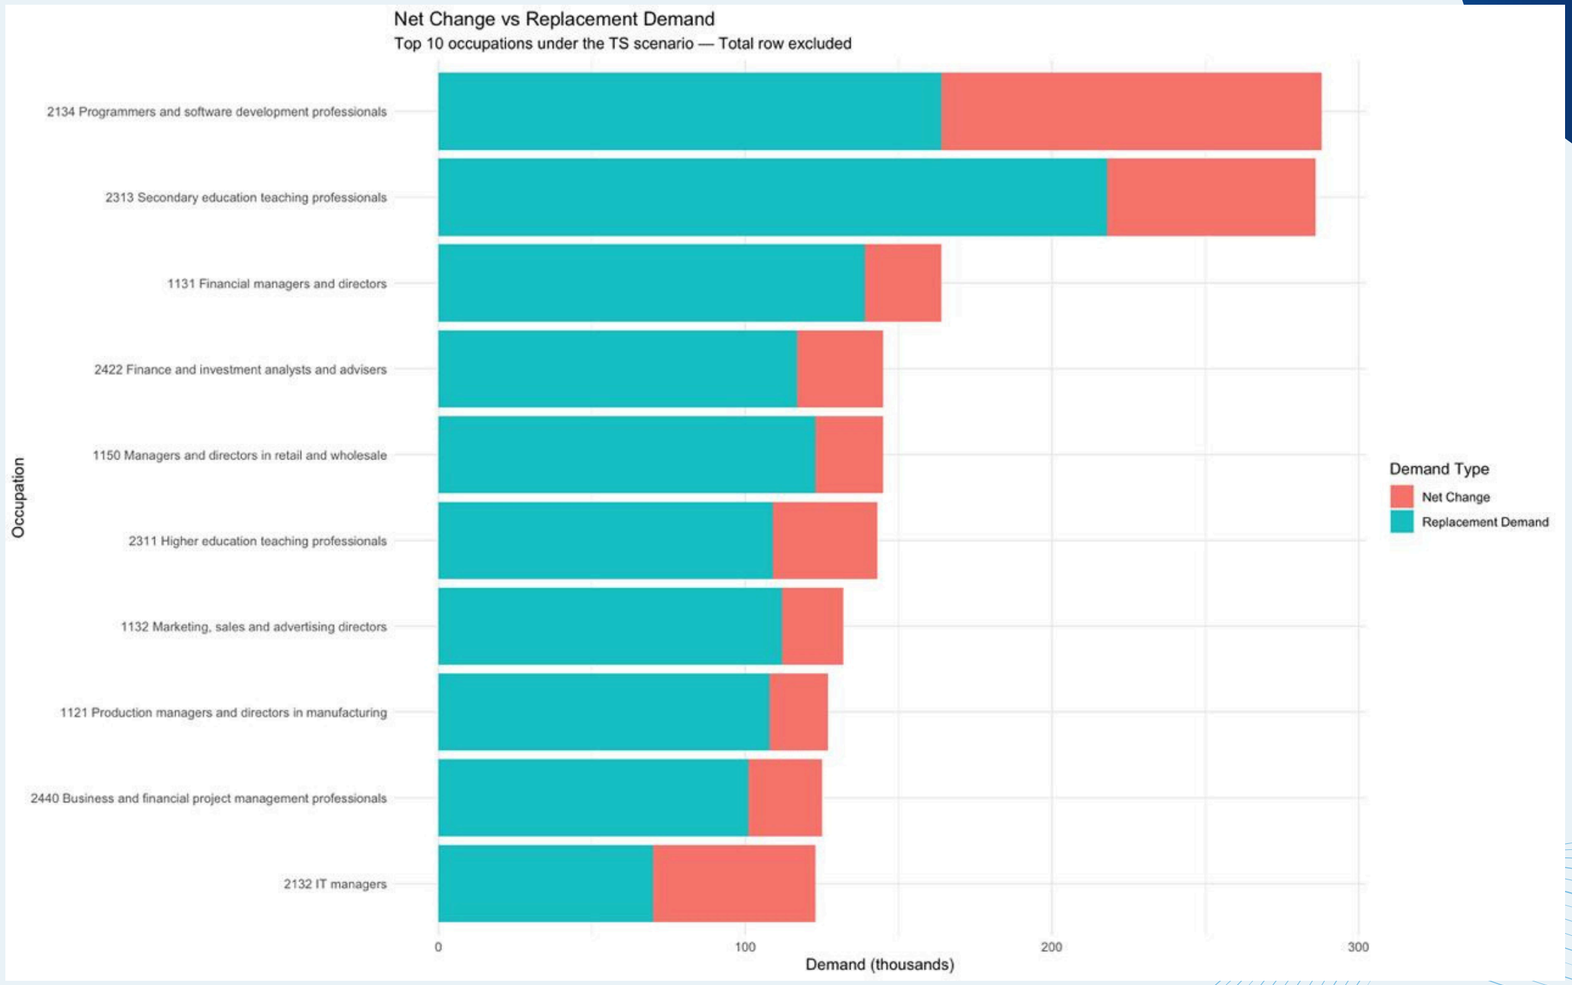

LARGEST EMPLOYMENT CHANGES BY OCCUPATION

Programmers show the largest absolute employment growth, while several IT and technology-related occupations also grow strongly, whereas a few occupations experience small declines.

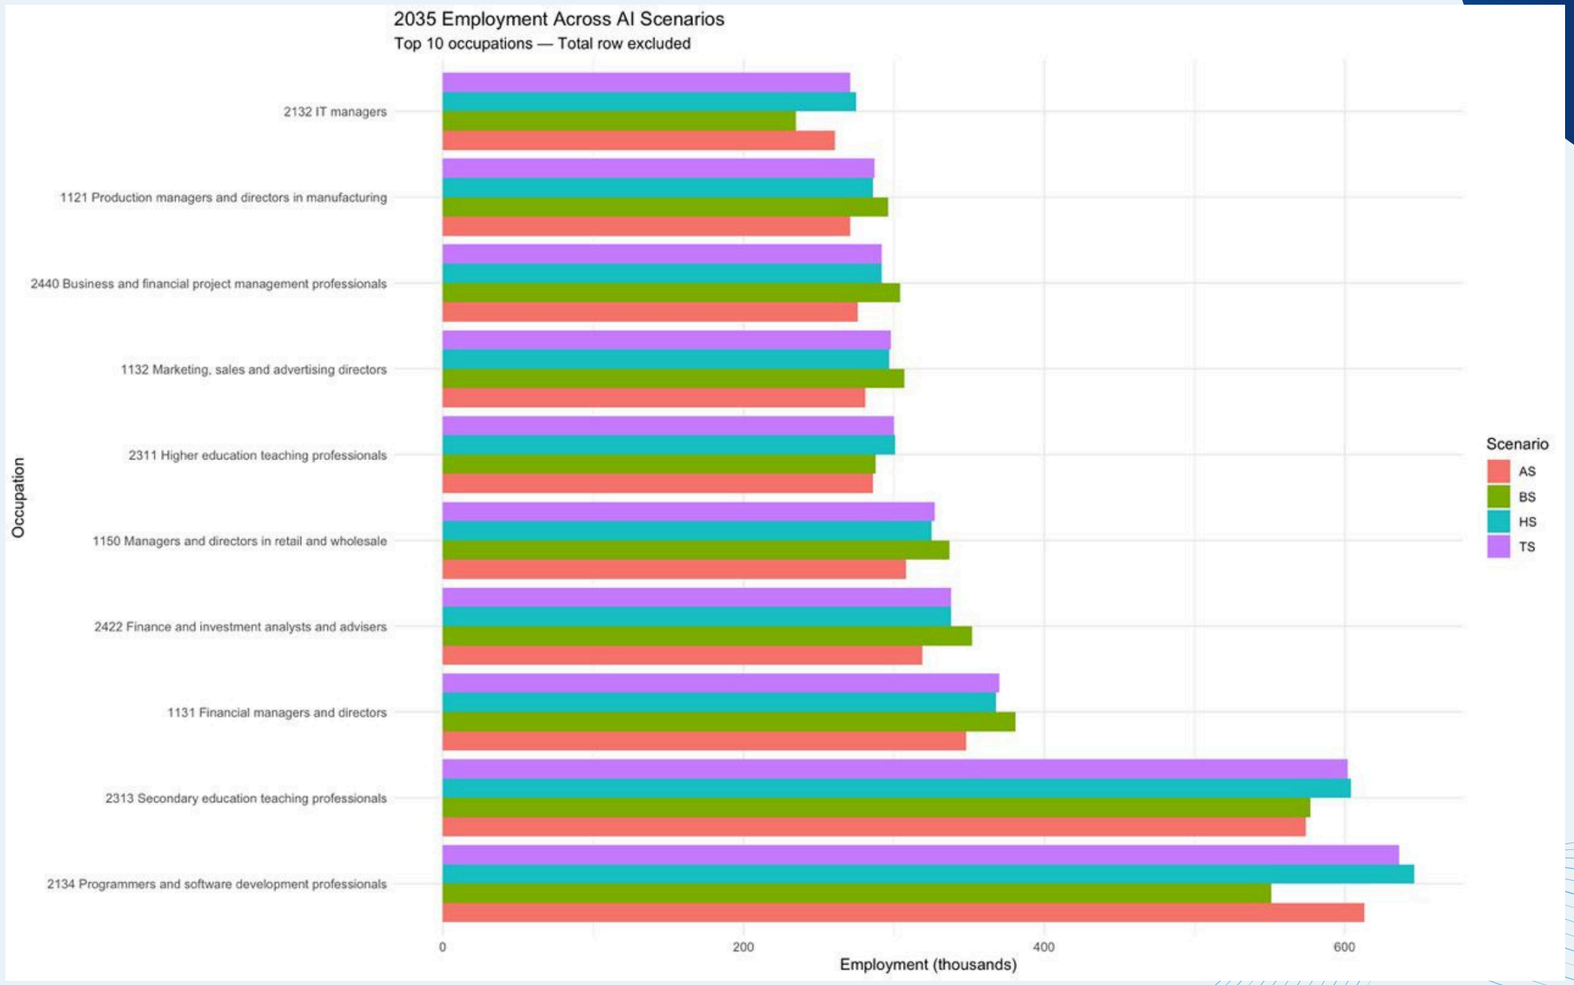

NET CHANGE VS REPLACEMENT DEMAND

Replacement demand forms a substantial share of future labour requirements, showing that employment opportunities arise not only from new jobs but also from replacing existing workers.

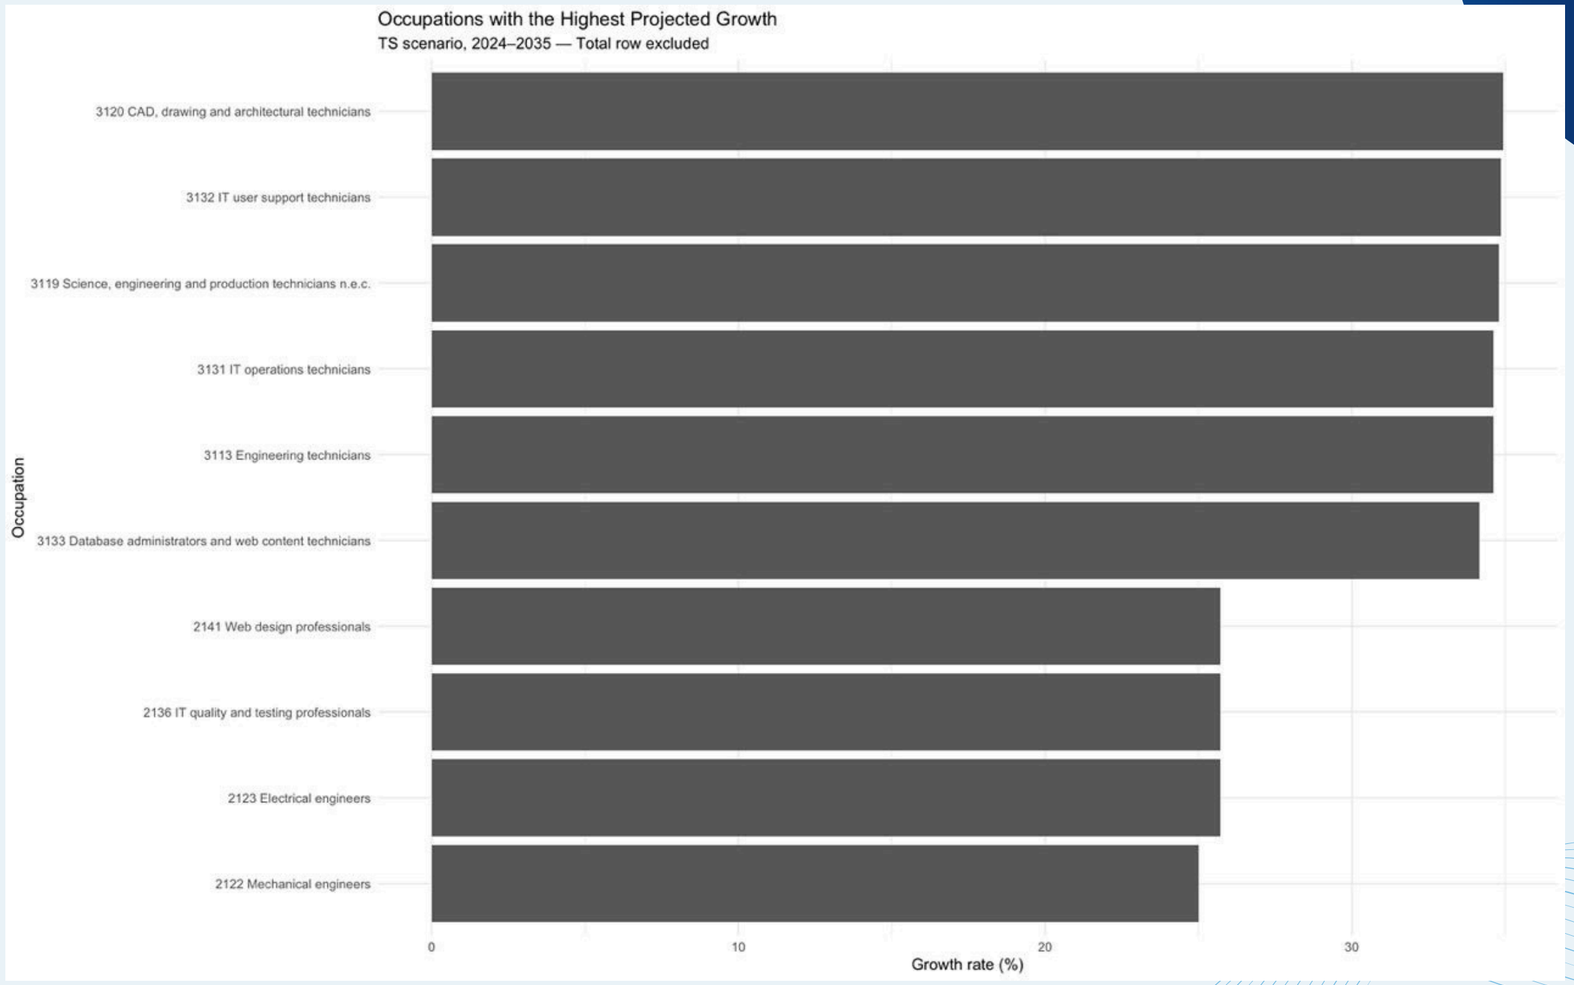

2035 EMPLOYMENT ACROSS AI SCENARIOS

Employment levels vary across scenarios, but programmers and secondary education teachers remain among the largest occupations across all four scenarios.

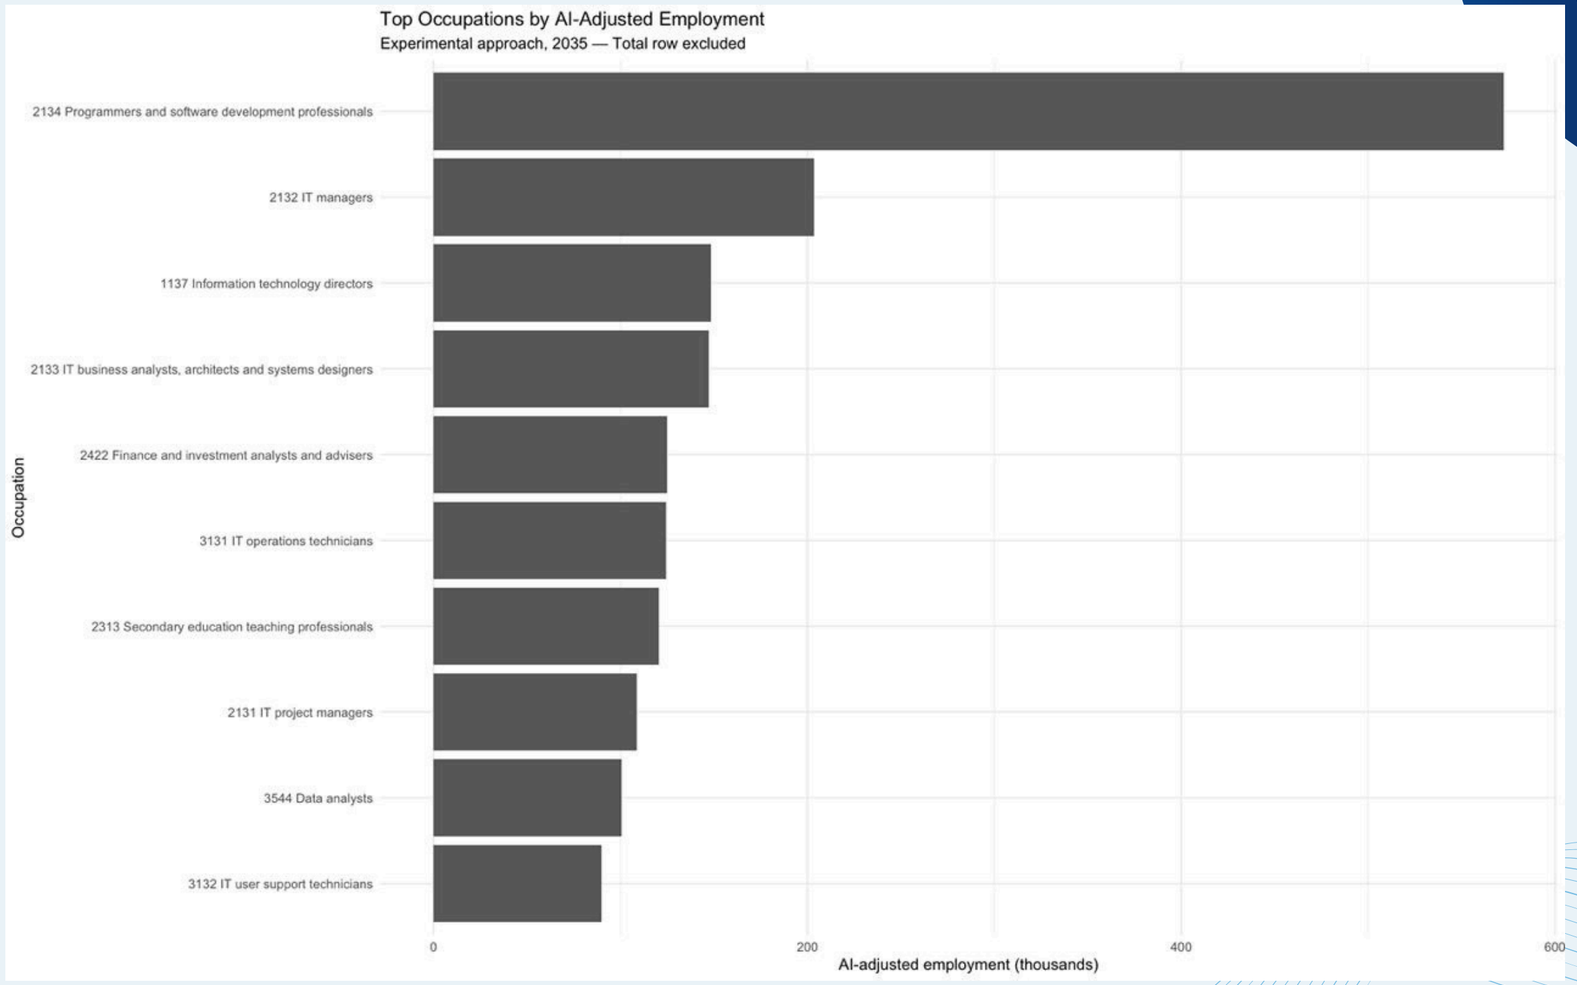

OCCUPATIONS WITH THE HIGHEST PROJECTED GROWTH

Technical occupations such as CAD technicians, IT support, engineering and database professionals show the highest percentage growth, indicating strong relative expansion in technology-oriented roles.

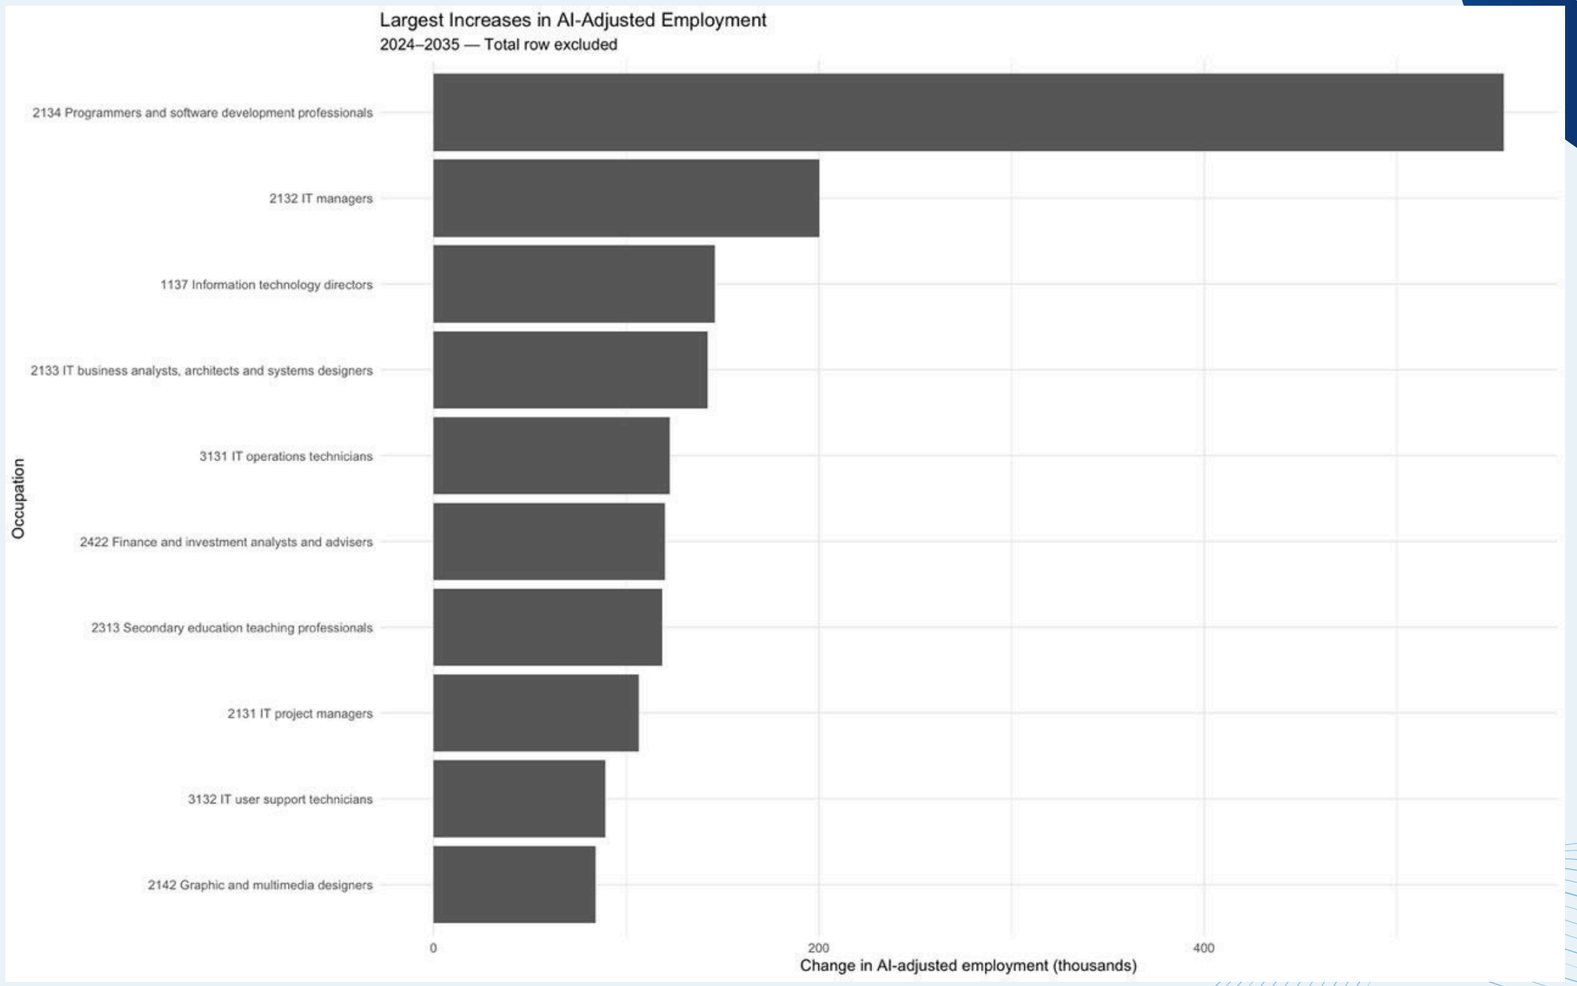

TOP OCCUPATIONS BY AI-ADJUSTED EMPLOYMENT

Programmers dominate the AI-adjusted employment measure, followed by IT managers and other technology-related occupations, highlighting the strong concentration of AI-related activity in the IT sector.

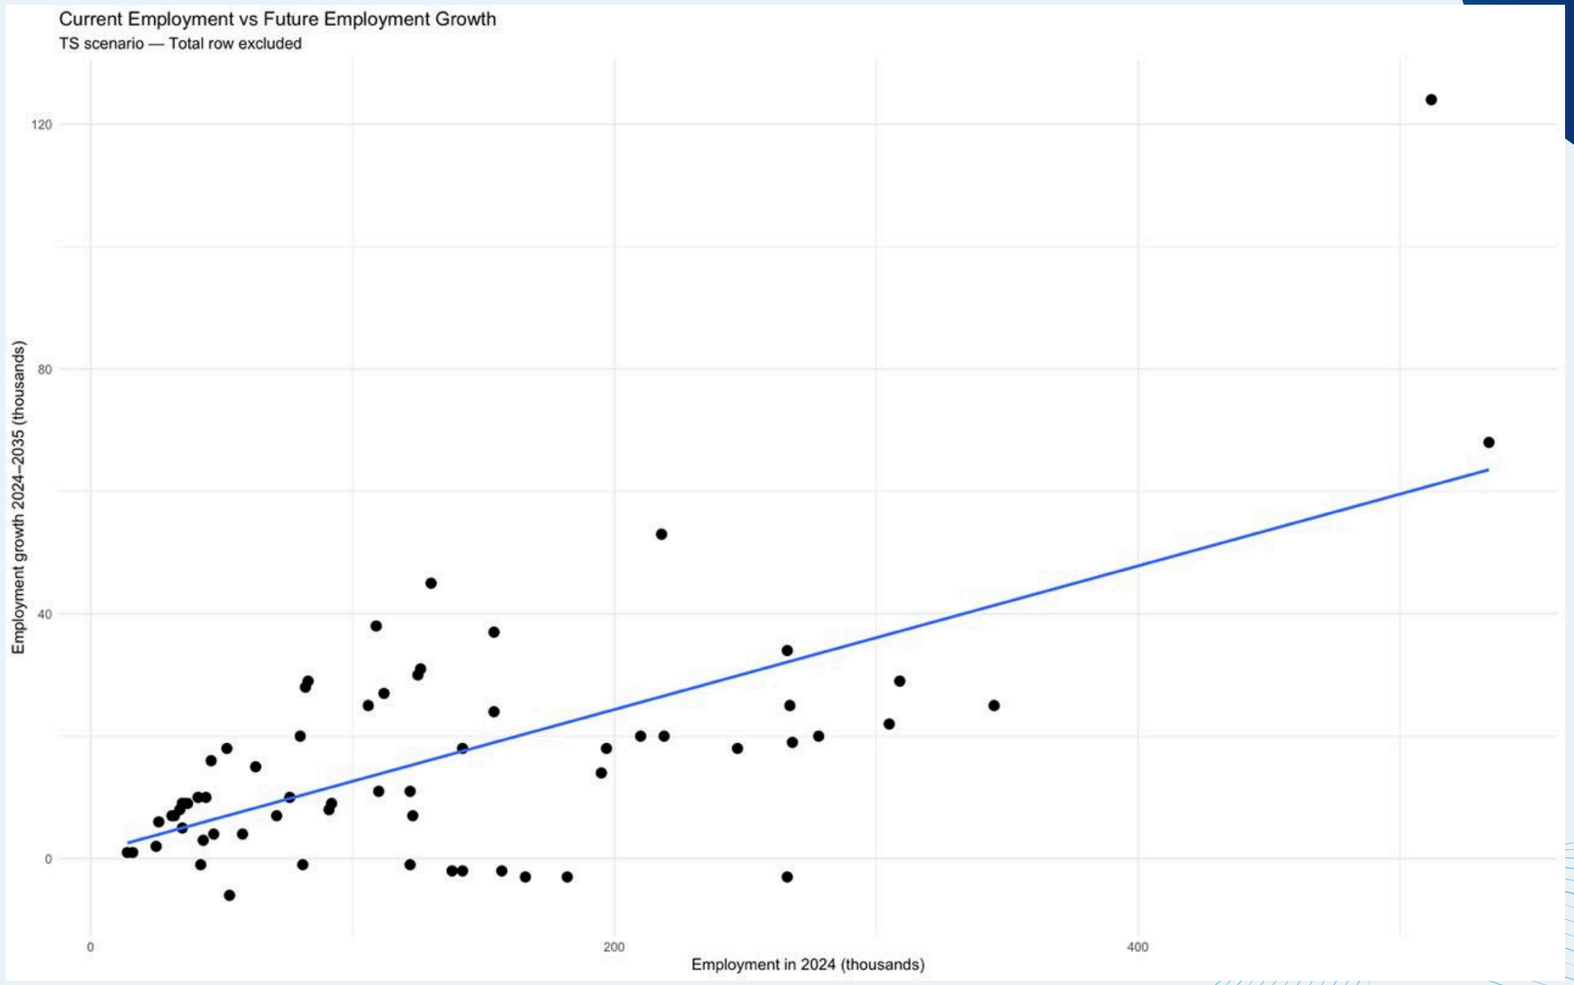

LARGEST INCREASES IN AI-ADJUSTED EMPLOYMENT

Programmers show by far the largest increase in AI-adjusted employment, followed by IT managers and IT directors, suggesting a major expansion of AI-related activity in technology occupations.

CURRENT EMPLOYMENT VS FUTURE EMPLOYMENT GROWTH

The positive trend line indicates that larger occupations generally tend to experience greater absolute employment growth, although substantial variation exists between individual occupations.

CONCLUSION

- AI will transform jobs more than replace them.
- Technology roles show the strongest growth by 2035.
- Replacement demand will remain a major source of opportunities.
- Reskilling will be critical for adapting to AI-driven employment changes.
